                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or ansal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinome. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; antisense; lung dysfunction; nasal airway dysfunction; antinflammatory steroid; ubiquinone; antinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
treating the above mentioned disorders. The present sequence is a primer used in arbitrarily-primed PCR (AP-PCR) analysis. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid
                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Aguilar D;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitificammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of, ung surfactant in a subject 's tissue, or a treating bronchoconstriction, lung surfactant in a subject's tissue, or a treating bronchoconstriction.
                                                                                                                                                                 ö
Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

first active agent comprising or purintential composition, which has a first active agent comprising or oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2.10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or misspant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. invention relates to a novel pharmaceutical composition, which has

ö inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and to Gaps oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and ; 0 Aguilar Pharmaceutical composition for treating asthma, has antisense 52.5%; Score 8.4; DB 1; Length 10; llarity 90.0%; Pred. contractant depletion or hyposecretion, when administered to a mammal. The oligomucleotides are derived from a gene encoding or regulating contractant depletion or hyposecretion, when administered to a mammal. The oligomucleotides are derived from a gene encoding or regulating dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery or lung dysfunction also describes a kit, that comprises: (a) a delivery of device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung continuation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproduction are associated distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligom corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligomucleotides into products that free adenosine into the system corresponding to the oligomucleotides into products that free adenosine into the system corresponding vector the edge of the oligomucleotides into products that free adenosine into the system corresponding to the oligomucleotides into product that the target that free adenosine the demosine correspond ö Human, antisense, bronchoconstriction, allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic, antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cycostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds. or (A) receptors, Gaps Aguilar D; ; Score 8.4; DB 1; Length 10; Pred. comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiathmatic, and the containers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

The present invention relates to mature and precursor chondromedin protein sequences. Also provided are the coding sequences. The sequences are useful for preventing and/or treating bone and articular diseases such as fracture, chondrodystrophy, osteodystrophy, osteoporosis, osteoarthritis, rheumatoid arthritis, synovitis and metabolic arthritis, and as markers in the diagnosis of the above conditions. The present sequence is a polynucleotide sequence shown in the exemplification of the
                                                                                                                       Novel chondromedin protein or salts, useful as diagnostic markers for osteitis, arthritis and for screening compounds useful in treating bone and articular diseases such as fracture, osteoarthritis, rheumatoid

nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.

The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity

The invention relates to the use of a type III restriction enzyme to isolate from cDNA of an expressed gene, a tag comprising more than 25 nucleotides and capable of identifying the expressed gene, where the 3 or carzyme and the 5' end of the tag is defined by the cleavage site of the type III restriction carzyme that is closest to the 3' end of the cDNA of the expressed gene, where tha 1s closest to the 3' end of the cDNA of the expressed gene. The invention also relates to a ditag-oligonuclectide comprising two tags each of which is derived from a different expressed gene, where each tag comprises more than 25 nucleotides and is capable of dentifying an expressed gene, where tha 1s nucleotides and is capable of a cleavage site of the type III restriction enzyme and the 5' end of the cDNA of the expressed gene to the 3' end of the cDNA of the expressed gene to the 3' end of the cDNA of the expressed gene comprising synthesizing a CDNA of the expressed gene at the cDNA of the expressed gene method comprising synthesizing a CDNA of the expression analysis method comprising synthesizing a CDNA pool from miNNA of expressed gene expression analysis cusing a primer comprising or CDNA of the cDNA pool with a recognition enzyme, followed by digestion of the cDNA pool, and ligating the fragments with the type of III restriction enzyme, digesting the recognition sequence of the cDNA pool, and ligating the resulting fragment comprising to linker-A to the resulting fragment comprising to linker-A to the resulting tragment comprising the certification enzyme, digesting the ligated fragments with the other certification enzyme, and ligating the resulting fragment comprising the linker-B after performing a diega-oligonucleotide a polymucleotide, and yazing the expressed gene, lidatifying the expressed gene, lidatifying the expressed gene, lidatifying the expressed gene based on the number of tags corresponding to the expressed gene based on the number of tags corresponding to the left of an expressed gene based on the number polynuclectide sequence and quantifying the expression level of an expressed gene based on the number of tags corresponding to the expressed gene included in the polynucleotide. The isolated tag allows accurate profiling This sequence represents a rice oligonucleotide used in the quantitative gene expression analysis and rapid gene expression in any organism for which no expressed sequence tag (EST) databa available. This sequence represents a rice oligonucleotide used

The invention relates to a novel method for detecting and distinguishing between, or among, colorectal cell proliferative disorders. The method involves contacting genomic DNA of a biological sample obtained from the subject with one or more reagent (s), or a series of reagents that distinguishes between methylated and non-methylated CpG dinucleotides within a target sequence of the genomic DNA. The invention further comprises: a nucleic acid comprising a sequence of 18 or more contiguous nucleotides of a treated genomic DNA sequence chosen from any one of 284 provided in the specification, and their complementary sequences, where the contiguous sequence has one or more CpG. TpA, or CpA dinucleotide, and the treatment is suitable to convert one or more of the unmethylated cytosine base (s) of the genomic DNA sequence initially to uracil or another base that is detectably dissimilar to cytosine in terms of hybridization; an oligomer or peptide nucleotides that is complementary to or the comprising 9 or more contiguous nucleotides that is complementary to or contiguous nucleotides that is complementary to or contiguous nucleotides that is conditions to one of the contiguous nucleotides that is conditions to one of

ö colorectal carcinoma, colon adenomas and colon polyps, in a biological sample, such as histological slides, biopsies, paraffin embedded tissue, bodily fluids, stool, blood, serum, plasma and their combinations. The oligomer array is useful as a probe for detecting one or more of the cytosine methylation state, or single nucleotide polymorphisms within the genomic DNA or their complementary sequences. The polymorleotides of the invention are useful for classifying, distinguishing between, or among, diagnosing or determining the predisposition for colorectal cell proliferative disorders, or for the therapy of colorectal cell proliferative disorders. This polymorleotide sequence represents a primer Detecting and/or differentiating prostate cell proliferative disorders in a subject by contacting genomic with reagent(s) that distinguishes between methylated and non-methylated CpG dinucleotides in target nucleic The invention describes a method of detecting and/or differentiating between prostate cell proliferative disorders in a subject comprising contacting genomic DNA isolated from a biological sample with at least one reagent or series of reagents that distinguishes between methylated and non-methylated CpG dinuclectides within one or a combination of trarget nucleic acids e.g. HISTONE H4. Also described are: a treated nucleic acid derived from SEQ ID NO: 1-59, 1017-1028, 1116, 1171, where the treatment converts at leas one unmethylated cytosine base of the genomic DNA sequence to uracil or another base that is detectable or among, colorectal cell proliferative disorders chosen from Gaps cell proliferation; hyperproliferation; cytostatic; Dekker S; ö Score 8.4; DB 1; Length 10; Pred. comprising at lest 16 contiguous nucleotides of a treated genomic DNA sequence selected from SEQ ID NO: 60-295, 1029-1076, 1177-1175.

Cand sequence selected from SEQ ID NO: 60-295, 1029-1076, 1117-1170, 1172-1175 and sequence scomplementary to them, an oligomer comprising a sequence of at least 9 contiguous nucleotides that is complementary to, or hybridizes under moderately stringent or stringent conditions to a treated genomic DNA sequence above; a set of oligomers comprising at least two oligomer comprising at least two oligomers comprising at least of oligomers comprising at least of subject comprising at least one of a bisulfite reagent, or a methylation-sensitive restriction enzyme, and at least one nucleic acid molecule or peptide nucleic acid molecule comprising a contiguous sequence at least 9 culeotides that is complementary to, or hybridizes under moderately stringent or stringent conditions to a sequence selected from SEQ ID NO: 60-295, 1029-1076, 1117-1120, 1172-1175 and their complements. The method, nucleic acid, oligomer, set of oligomucleotide, and kit are useful for detecting and/or differentiating between or among cell proliferative disorders. This sequence represents a primer used to analyze methylation status of genes encoding a prostate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the sequence of bases 910-920 of pertussis toxin S1 subunit gene after the primer of AAN90192 has been used to substitute G1y 99 with G1u see also AAN90188-91, and AAN90194-207. This sequence represents an adapter primer oligonucleotide. It was used to isolate CAG repeat containing sequences from the human genome to test the method of the invention. The method is for analysing nucleic acids in a sample, and comprises: (a) providing a sample containing nucleic acid, a first oligonucleotide primer comprising a CAG repeat, a second coligonucleotide primer comprising a CAG repeat and a polymerase and PCR reagents; (b) preparing said mucleic acid so that it is amplifiable; (c) amplifying the nucleic acid with the first and second primers; and (d) detecting the amplified product. The method is used to distinguish compression of genes in two or more biological samples, e.g. body fluids, cells, solid tisgue or solid and liquid foods. It can be used in medical diagnostics, e.g. to differentiate between normal and diseased tissue or to assess the variation within monozygotic twin pairs. The method allows the isolation and analysis of genome subsets containing CAG repeats which are known to be important in a number of neurological in which nonly fragments which contain a target repeat are efficiently amplified. This allows accurate identification of differentially amplified. This allows accurate identification of differentially amplified. This allows cell types. Genome complexity is reduced by the new method which targets genomic subsets containing CAG repeats
                                                                                                                                            ö

```
Sequences AAV46501-V47446 are anti-sense oligonuclectides that target the human adenosine A1 receptor, the design of which required the secondary contracture of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonuclectides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their containing either are created they can be used to target their containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-containing cities and product to decrease. The containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-containing cities associated with bronchoconstriction and/or lung confitions associated with bronchoconstriction and/or lung confitions associated with bronchoconstriction and/or lung confitions are confitions associated with bronchoconstriction and/or lung confitions associated with bronchoconstriction and/or lung confitions are confitions associated with bronchoconstriction and/or lung confit and confit an

The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inflammation in humans or other animals e.g. asthma, pulmonary disease,

```
The present invention describes Wnt-1 induced secreted polypeptides, WISP-2 and WISP-1, 2 and 3. The novel WISP polypeptides, designated WISP-1, WISP-2 and WISP-3 have homology to connective tissue growth factor (CTGF). Products from the present invention can be used to treat WISP-related disorders such as breast, ovarian, and colon cancer or melanoma. The products can also be used to treat colon cancer or melanoma in the product or glandular, macrophagal, epithelial, stromal, and blastcockers, bone-related disorders und cancer such as osteoporosis, trauma such as burns, incisions, and cisorders connective tissue disorders, catabolic states, testicular callated disorders, and inflammatory, angiogenic and immunologic disorders including arteriosolerosis. The products can also be used for detection can diagnosis especially of individuals with neoplastic cell growth or proliferation. The products can be used in the production of transgenic or knock-out animals. Antibodies can be used to induce death in WISP-1, 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WNT-1 induced secreted protein; WISP-1; WISP-2; WISP-3; CTGF; tumour; connective tissue growth factor; cancer; melanoma; arteriosciarosis; leukaemia, lymphoid malignancy; haemetopiosis-related disorder; tissue-growth disorder; skin disorder; desmoplasia; fibrotic lesion; kidney disorder; bone-related disorder; osteoporosis; trauma; burn; connective tissue disorder; catabolic state; inflammation; testicular-related disorder; angiogenesis; immunological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

New antisense oligonucleotides used in treatment of, e.g. pulmonary (UYEC-) UNIV EAST CAROLINA WPI; 1999-229400/19. Nyce JW;

Disclosure; Page 40; 120pp; English. vasoconstriction

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genemic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense cligonucleotides may be derived from sequences AAX5572-74. These multiple target oligonucleotides may be derived from sequences AAX5572-74. These multiple target oligonucleotides are those associated with impaired respiration and inflammation, including lung diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, coll stress syndrome, pain, cystic fibrosis, pulmonary hypertension, clastress syndrome, pain, cystic fibrosis, pulmonary hypertension, coll stress syndrome, pain, experience and charcers such as leukemias implement of the sast cancer, lung cancer, pancreatic cancer, colon cancer, breast cancer, lung cancer, pancreatic cancer, respiration and processized in the lung including breast and processized or have metastasized to the lung including breast and processized or have metastasized or her lung as all the partic metastasized as a second and access and processized or have metastasized as the lung as all the partic metastasized as a second and access and to the lungs, including breast and prostate cancer

The present invention describes a new composition composition conjugates and an artisense oligomucleotide (NN) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or antiasthmation. The ON can have antiinflammatory, antiallergic, and/or antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breat and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the concernation of inflammation. AAA13112 to AAA31312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 cequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA3392) are specifically claimed ONS from the present invention NB. Sequences given in the disclosure of the present invention to match

The ON can have antiinflammatory, antiallergie, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating eg. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cyetic fibrosis, pulmonary hypertension, emphysema, chronic obstructive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pulmonary disease (COPE), and cancers such as leukaemias, lymphomas, carcinomary disease (COPE), and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardipoulmonary and/or renal damage and/or failure.
(I) is an adenosine Aza receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic falanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine Al, AZa, AZb or A3 receptors, and has Al, AZb or A3 agonist activity or AZa antagonist activity or Aza antagonist activity or Aza antagonist activity or Aza antagonist activity at this receptor). (I) may be a mixture of (Ia) and optionally also contains one or more surfactants. The
nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 18 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32322 to AAA3392) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; adenosine Al receptor; antisense oligonucleotide; hypoxia; adenosine As receptor; adenosine As receptor; adenosine As receptor; phosphorothicate; cardiopulmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; enguraventricular tachycardia; allergic rhinitis; acute inflammation; chronic obstructive pulmonary disease; ss.

Claim 14; Page 117; 1592pp; English.

genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all cast or segments of mRNA encoding the adenosine AI, A22, A2D or A3 receptors, and has A1, A2D or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive (e.g. associated with sepsis); allergic rhinitis; chronic obstructive of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothicate antisense oligonucleotides for use in the composition of the present invention. AAA02718, AAA02718, AAA02722 and AAA03716 to AAA03720 represent of the present of the phosphorothicate oligonucleotides used in the exemplification of the ö Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis; Gaps ö 52.5%; Score 8.4; DB 1; Length 11; 90.0%; Pred. Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

```
The present live and compositions (1) comprising them. In the antisense oligonucleotides and compositions (1) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (1) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antisathmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (1) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and mallagancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction which are associated with a glease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to the novel human foetal liver proteins flas53 (AAB2944) and flas65 (L variant (AAB2945) and S variant (AAB2946), and to nucleic acids encoding them (AAC3860-C63862). The invention also relates to expression vectors and host cells comprising an flas53 or flas65 DNA, the recombinant production of the proteins, antibodies against the proteins, and a method for screening compounds for their ability to bind to, and to inhibit or promote the expression of the proteins. The flas53 and flas85 proteins and nucleic acids can be used to identify compounds which regulate the activity and expression of the proteins. Such compounds may be used as anticancer agents. The present sequence represents an adapter used in the isolation of flas53 and flas88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGB; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and mallymancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central contracts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       receptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to tract disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or
                                                                                                                                                                                                                          Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polymucleotide fragments and antisense oligonucleotides used in the exemplification of

                                          The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

; 0 polypeptides), and the polynucleotide sequences encoding them. The novel WISP proteins (WISP-1, WISP-3) show homology to connective tissue growth factor (CTGP. Also disclosed are vectors and host cells comprising WISP polynucleotides, chimeric polypeptides comprising WISP polynucleotides, chimeric polypeptides comprising WISP polypeptides, chimeric polypeptides which bind WISP polypeptides, and methods for producing the polypeptides. The antibody may be used in a composition to inhibit the growth of tumour cells by inducing death of the cells which are overexpressing the WISP polypeptides. The WISP polypucleotide sequences are useful for preparing a composition for treating WISP-related disorders such as atherosclerosis New apparatus with a substrate and a modified nucleotide aptamer for monitoring biological interactions, useful for diagnosing and treating NP-kB aptamer-related diseases, such as toxic shock, rheumatoid arthritis, monitoring biological interaction; modified aptamer;

to the substrate, where a target molecule or its portion, contacted with the modified aptamer under conditions to allow formation of a complex between the modified aptamer and the target molecule or its portion, is detected. The invention may be useful in developing phosphorothicate agonists or antagonists which may have antibacterial, immunosuppressive, antiarteriosclerotic, ortiantlammatory, cytostatic, anti-HIV, antiarteriosclerotic, virucide or neuroprotective activities. The methods biological interactions and in functional proteomics. As an example, nuclear factor kappa-B (NP-kappaB) aptamers can be used in diagnosing biological interactions and in functional proteomics. As an example, retemined of arthritis, crohn's disease, such as toxic shock, sepsis, retematod arthritis, crohn's disease, such as toxic shock, sepsis, retematod arthritis, crohn's disease, generalised inflammatory bowel disease, asbestos lung diseases, HOGGKIN's disease, prostate cancer, ventilator induced lung injury, general cancer, AlDS, human cutaneous reconstruction and proper simplex virus, JCV, SV-40, rhinovirus, influenza, neurological disorders and lymphomas. The correction of the processes of the present sequence is that of an oligoniclectide duplex which was used divining the construction of the processes of the present sequence is that of an oligoniclectide duplex which was used

              CBP-4, the CBP-4 polygeptide, and antibodies to GBP-4 are useful in retaring myelodysplastic disorders, myeloproliferative syndromes, acute melanoma). The polynucleotide sequence is useful as hybridisation probes, in chromosome and gene mapping, in generating transgenic animals, in chromosome and gene mapping, in generating transgenic animals, in combating immunosasay, in inducing formation of anti-GBP-4 antibodies, in combating immunological and inflammatory responses and other pathological conditions (e.g. multiple sclerosis or lung and intestinal-related disorders), as a mediator of any interferon-gamma-induced responses in macrophages and fibroblasts, and may also function in other immune cell populations or in protein processing. The present sequence represents an adaptor used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel treatment for lung cancer comprising antibodies that bind to the IL-20 receptor beta-chain. An antibody of the invention has cytostatic activity, and controls function and expression of IL-20 receptor beta-chain. The invention is useful for detection and treatment of lung cancer. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   88; lung cancer; cancer; antibody; cytostatic; IL-20 receptor beta-chain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treatment for lung cancer comprises antibodies against IL-20 receptor beta-chain and antisense polynucleotides for controlling beta chain
                                                                                                                                                                                                                                                                                                                                                          Gaps

first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiliflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for for enhancing the prophylactic or therapeutic respiratory effect of an artifulflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine antime antiger or antigened 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating ailments associated with impaired

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, readerory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, controlleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of the invention has antialergic, antiinflammatcry, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary characterin pulmonary disease, pulmonary characterin, pulmonary infections, bronchitis or cancer.
                                                                                                                                                                                                                                                                                                                     Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antisethmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pabalan J, Aguilar D;

The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lumg, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating broncheconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating of preparation of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containners, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antisathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a Human; antisense; bronchoconstriction, allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic, antifinflammatory; antiastenstic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distracts syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds. beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies athma, impeded respiration, respiratory diserses or condition such as pulmonary vasoconstriction, inflammation, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.s., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

particular of DNA in which a molecule is multiply anchored at one end to a fixed surface and at its other end to a paramagnetic bead. Also included is an apparatus for the manipulating and testing of molecules, e.g. DNA, comprising a surface to which the molecule is anchored at multiple points at one end by a paramagnetic bead, magnetic forces to control the stretching and rotation of the bead and molecule, optical magnification and a camera for the visualisation of the bead and a computer for analysing motions of the bead from the transmitted camera computer for analysing motions of the bead from the transmitted camera computer for analysing motions of the bead from the transmitted camera computer for analysing motions of the bead is covered with streptavidin. The dispoxigenin at its other end. The surface is covered with streptavidin. The calasticity of the molecules is first determined to select the bead(s) on which just one molecule is a strached. The elasticity of a molecule is a trached. The elasticity of a molecule is changed by rotating the beads around the magnification axis. The cannitoring of the force or of the extension of the molecule is used to apparatus are useful for manipulating and testing DNA by twisting or coiling it can be measured in real-time. The methods and apparatus do not need force calibrations, nor sophisticated tools unlike prior art methods. They also allow real time control of the twisting of a molecule such as DNA in a continuous, reversible and quantitative manner. The present sequence is the unpaired 5' end of phage lambda DNA, which can be used to circularise molecules incorporating it and the 3' unpaired can be used to circularise molecules incorporating it and the 3' unpaired ö Novel chondromedin protein or salts, useful as diagnostic markers for osteitis, arthritis and for screening compounds useful in treating bone and articular diseases such as fracture, osteoarthritis, rheumatoid human; osteopathic; antiarthritic; antirheumatic; chondromedin; marker; Gaps ; Score 8.4; DB 1; Length 11; Pred. This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and its method for determining homeostasis of human facial skin, a test kit which comprises a solid support (flexible or rigid) on which are immobilised probes that bind specifically to the factors of interest and a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or cosmetic and pharmaceutical agents for use against disorders or
                                                                          such as fracture, chondrodystrophy, osteodystrophy, osteoporosis, osteoarthritis, rheumatoid arthritis, synovitis and metabolic arthritis, and as markers in the diagnosis of the above conditions. The present sequence is a polynucleotide sequence shown in the exemplification of the
                The present invention relates to mature and precursor chondromedin protein sequences. Also provided are the coding sequences. The sequences are useful for preventing and/or treating bone and articular diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          adaptor molecule. The upper strand sequence is also provided AD073965. The adaptor was added to CDNA samples derived from Melampsora lini (flax rust) RNA in the preparation of driver and tester CDNAs for subtractive hybridizations. Libraries were constructed from subtracted cDNAs and used to identify nucleic acids AD073956 encoding avirulence products AD073951-AD073962 of M. lini. Such nucleic acid molecules can be used in transformation of a plant to induce a disease resistance response in the plant, optionally by co-expression with a corresponding disease resistance gene in the plant. The transformed plant is a crop or cereal plant, especially flax or tobacco.
               identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. AD031911-AD035111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule comprising a sequence of nucleotides encoding or complementary to a sequence of nucleotides encoding an avirulence product of a plant rust fungus, useful in inducing a disease resistance response in a plant.

                                                                                                                                                                                                                                                                                                                                                                                                                                 (GBP-4; ADU55645) and its coding ageneric (ADU59643 and ADU55673). The CDAR clone encoding GBP-4 was isolated from a gastric adenocarcinoma by suppressive subtractive hybridization (SSH). The human GBP-4 gene was localized to chromosome 1p31-1p32. Immunoelectron microscopy indicated that GBP-4 is associated with the membranes of endolysosomes. GBP-4 was found to be expressed in many normal rissues, with the highest levels in peripheral blood leukcytes, lymph node and the spleen as well as gastric adenocarcinoma tissue. GBP-4 expression is induced in human cell lines by gamma-interferon (IFN-gamma). GBP-4 is useful in preparing a composition for treating inflammatory damacers or cancer. The present
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a novel human guanylate-binding protein
                                                                                                                                                                                                                                                                                                                                                                    New guanylate-binding protein-4 (GBP-4) polypeptide, useful in preparing a composition for treating inflammatory disorders or cancer.

The invention relates to a method of analyzing haplotype, by detecting gene polymorphism in drug-related genes such as aryl acceylamide deacetylase, arylalkylamine Nacetyl transferase or ATP-binding cassette, sub-family A (ABC1), member 1. The method is useful for analyzing haplotype. The method is useful for selecting medicine for ca foreign meterial, for selecting medicine for consequence or a foreign meterial, for selecting medicine for medicine or a foreign meterial, for determining appropriate dosage of medicine for preventing or treating disease, for analyzing a drug interaction, and for determining the related polymorphism relative to the sensitivity of the medicine, foreign material or disease. The disease include malignant tumor, immune disorder circulatory disease, metabolic disease, kidney disease, respiratory disease and muscle associated disease. The method enables analysis of the individual differences related to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analyzing haplotype, by detecting polymorphism in drug-related genes, electing common polymorphism (CP), building haplotype block using CP, specifying CP within block, specifying tag polymorphism from CP within block.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          요
                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAT41821-29 represent probes which were used to resolve the human leukocyte antigen (HLA) DQB1*03 alleles. This probe sequence hybridises to sequences found in alleles 0302 and 0304. These probes may be used in the method of invention which concerns HLA typing of a sample for an unknown pair of alleles. The pair of alleles comprises come of two known types which have the same overall set of polymorphisms but have a different distribution of polymorphisms between their two alleles. The method comprises selectively amplifying the DNA of just one which polymorphisms are present in that allele, and therefore assigning the unknown pair to the known type having that allele. The method comprises three test stages. The first stage is to establish the number of alleles present in each sample. Primers corresponding to fairly well conserved regions of a locus will increase the likelihood that unknown conserved regions of a locus will increase the likelihood that unknown a probe. In the second stage, the group or basic type identified and potentially detected by hybridisation with a probe. In the second stage, the group or basic type identified of etermines which set of allele specific primers will be used. The first of the two primers comprises an opt. labeled sequence common to each allele of the group identified in the first stage but different from cother groups identified in stage one. The second primer may be adone by the different labeled primers, complementary to two or more sequences of different labeled primers, complementary to two or more sequences within the group, or the amplification one. The second primer to detect the presence of a single group of alleles. In the second primer to detect the presence of a single group of alleles. The method of the invention esp. distinguishes between the population using a radiolabballed probe. The method of the invention esp. distinguishes between the 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                         Human leukocyte antigen typing of tissue samples - using allele-specific amplification to distinguish allele pairs.

Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine AI receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the Gprotein coupled family of call surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                      Secondary structure; mRNA; phosphorothioate backbone; G-protein; bronchoconstriction; lung inflammation; asthma; pulmonary disease; allergy; emphysema; cystic fibrosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                              /*tag= a
/note= "contains phosphorothioate internucleotide
linkages"
Antisense oligonucleotide 808, targeting adenosine Al receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide 691, targeting adenosine Al receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine A1 receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and on the provent conditions associated with the pronchoconstriction and or the dispersent conditions associated with the pronchoconstriction and or the dispersent conditions associated with the pronchoconstriction and or the process and the proposed the process of the process of the dispersent conditions associated with the pronchoconstriction and or the process of the process 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions or mixtures. Typical diseases and conditions are those
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
caute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
clistress syndrome, pain, cystic fibrosis, pulmonary hypertension,
clistress such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
colon sancers which may metastasize or have metastasized
colon tancers which may metastasize or have metastasized
impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides used in treatment of, e.g. pulmonary

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons or mixtures. The antisense coligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
conditions or mixtures. The mention and inflammation, including lung
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
caute asthma, allergies, asthma, impeded respiration, respiratory
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastasized
colon cancer, breast cancer, melanoma, hepatic metastasized
colon cancer, breast and prostate cancer
               Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antisermentic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, imposed respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including or carcinomas, and cancers which may metastasise to the lungs, including or content of the content of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention of match up with their corresponding SEQ ID NO: sequences given in the sequence

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets conditions involved in bronchoconstriction, allergies, and/or antialetacid acids involved in bronchoconstriction, allergies, and/or confidential through an antialetacy, antialetacic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impaced respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including carcinomas, and cancers which may metastasise to the lungs, including cracinomas, and cancers which may metastasise to the lungs, including cracinomas, and cancers which may metastasise to the lungs, including cracinomas, and cancers which activates adenosine content of the concerning one broad down with the correspond to SEQ ID NO:1 to 2815, and then the present the invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 from the previously named sequences. SEQ ID NO:1 to 1860 (AAA31392) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. Sequences given in the disclosure of the present invention on the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        with their corresponding SEQ ID NO: sequences given in the sequence

The lingual relates to new methods of determining the Dinnorton relates to new methods or determining the Dinnorton relates to new methods or determining the digand to an oligonucleoride sequence, particularly to a duplex. The ligand is typically a metal ion, a small organic or inorganic molecule, a protein or a multi-protein complex. The methods comprise measuring the effect of adding increasing amounts of a ligand on a signal generated by two indicator oligonucleorides of the duplex. In the absence of ligand, two indicator oligonucleorides of ligand to double-stranded nucleic acids conditions are such that the oligonucleorides exist primarily in single-stranded form, binding of ligand to double-stranded nucleic acids the indicator oligonucleorides contains a first group contains a second group that duplex formation is favoured. One of the indicator oligonucleorides contains a second group that on hybridisation of the two indicator contains a second group that on hybridisation of the two indicator. The signal may be increased or decreased on hybridisation. For example, the signal may be increased or decreased on hybridisation. For example, the signal may be increase in signal intensity indicates that scintillant (where an increase in signal intensity indicates that scintillant (where an increase in signal intensity indicates that hybridisation has cocurred). Other methods of the invention comprise a strand diplacement assay, where the ability of an unlabelled displace one of the oligonucleotide is determined in the absence and presence of ligand; and a competition assay, where an unlabelled single or double-stranded competitor oligonucleotide sequence. They are particularly useful for determining the binding affinities of various oligonucleotide sequences. Particularly double-stranded oligonucleotide sequences. The sequences may be added to the ligand be acided to a dignal content configuration assays allow rapid and convenient determination of nucleic acide binding affinities. Sequences the invention sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to new methods of determining the binding affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining binding affinity of a ligand to an oligonucleotide sequence in double stranded form, comprises measuring the effect of adding increasing amounts of a ligand on a signal generated by two indicator
                                                                                                                                                                                                                                                                                                                                          Nucleic acid ligand binding assay; duplex formation; stability; detectable signal; competition assay; competitor oligonucleotide; ds.
                                                                                                                                                                                                                                                                                             DNA ligand binding assay competitor oligonucleotide, SEQ ID NO:30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 7-8; Page 20; 78pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (GENE-) GENELABS TECHNOLOGIES INC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Suh YJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonucleotides of the duplex.
                                                                                                                                                           AAA10347 standard; DNA; 12 BP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      99WO-US020719.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    98US-00151890.
                                                                                                                                                                                                                                                  03-JUL-2000 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Schroth GP, Bruice TW,

                                                                                                                                                                                                           g
                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                    The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide corresponding RNa, to genomic flanking regions or orersponding RNa, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2b or A3 receptors, and has to agonist activity or A2a antagonist activity for at least no agonist activity at this receptor). (I) may be a mixture of Ia) and (1b), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary bypoxia associated with administration

(I) is an adenosine Aza receptor agonist (Ia), or an oligomucleotide (Ib), containing less than 15* adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine Al, Aza, Azb or Az receptors, and has Al, Azb or Az agonist activity or Aza antagonist activity (or at least no agonist activity at this receptors). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine
of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothioate antisense oligonuclectices for use in the composition of the present invention. AAA02718, AAA02720, AAA02721 and AAA03716 to AAA03720 represent other phosphorothioate oligonuclectides used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adenosine A2a receptor; adenosine Ab receptor; adenosine A3 receptor; phosphorothicate; cardiopulmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; supraventricular tachycardia; allergic rhinitis; acute inflammation; chronic obstructive pulmonary disease; ss.

receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02711, AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothicate antisense oligonucleotides for use in the composition of the present invention. AAA02718, AAA02720, AAA02710 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Low adenosine (A) content antisense oligonucleotides which do not trigger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        adenosine receptors during metabolism, useful e.g. for treating cancers
                                                                                                                                                                                                                                                                                                                                                                              Gaps

The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with corpression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodes, antibody receptors, cytokines and activating proteins, adenosine receptors, cytokines and chemokines endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central cremokines receptors, and peripheral nervous and non-nervous system receptors, and peripheral nervous and non-nervous system creceptors, and peripheral nervous and non-nervous system creceptors, and peripheral nervous and non-nervous system creceptors, binding proteins and malignancy associated proteins. The receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergic syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary disease syndrome company transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragment invents and antisense oligonucleotides used in the exemplification of the manner of the content of the processor of the present invents and antisense oligonucleotides used in the exemplification of human, airway disorder; bronchoconstriction; lung inflammation; businfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiathmatic; analgesic; hypotensive; oytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis; immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to dom-regulate the expression and or activity of target polypeptides associated with cattoring peptide factors and malignancies, such as stimulating and cattoring peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokine receptors, adenosine receptors, bradykinin receptors, cutrail controls system (CNS) and peripheral nervous and non-nervous system (CNS) and peripheral nervous and non-nervous system (CNS) and peripheral nervous and non-nervous system creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy (ies) and/or condition selected from pulmonary vasocoated with a disease or condition selected from pulmonary vasocoated with a disease or condition as asthma, impeded respiration, respiratory disease syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary imperation rejection; nulmonary infertions, bronchitis
                                             Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABR00010-ABR99989, ABR00010-ABR99989, ABR00010-ABR99989, ABR00010-ABR99899 and ABI00010-ABR3073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide primer SEQ ID NO 322459 for detecting SNP TSC0030884.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and range of diseases including immune system, gastrointestinal, respiratory. Central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABC0010-ABB9989, ABC0010-ABB9989, ABC0010-ABB9989 and ABI0010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The invention relates to a method of cloning a structurally characterised DNA or a flanking DNA containing part of the characterised characterised bnA or a flanking DNA containing part of the characterised valid creator by concentrating the DNA of interest using a substance which specifically recognises the structurally characterised region or a fragment thereof, and selectively cloning only the DNA of interest by subtraction treatment. The invention especially relates to a method for cloning or detecting a minutely mutated DNA by concentrating the mutated DNA using a substance (such as a mismatch repair protein) which specifically recognises mismatched DNA, and selectively cloning only the cutant DNA. Such a method of detection. The method was exemplified by the cloning and sequencing of DNA from the PAO128 strain of Pseudomonas ceruginosa using an immobilised maltose binding protein (MBP)-MUTS fusion protein, and the corresponding DNA from Pseudomonas aeruginosa strain companied mismatches in PAO1/PAO128 DNA duplexes. The cutant (1.e., PAO128) DNA was thus concentrated, amplified via PCR, and contaminating DNA removed by RDA. A Pseudomonas aeruginosa strain PAO128 (1brary was constructed and its genome sequenced Such a protocol may be used for the detection of Pseudomonas aeruginosa strain PAO128 (1brary was constructed, amplification of the crepresent the strands of an adapter used in an exemplification of the interval of an adapter used in an exemplification of the interval.

The invention relates to a method for determining the relative binding affinities of a ligand to different oligonucleotides. A mixture is formed from two oligonucleotides, one carrying a label and a second containing a group that alters the signal from the label, when the sequences hybridise. In the absence of the ligand, the oligonucleotides exist mainly in single-stranded form and the signal is recorded in this state. The ligand is then added and the signal measured again, and the effect compared with that observed for a different pair of oligon. The relative binding affinities of the ligands are determined by comparing their effects. Sequences ABK70559-ABK70629 represent oligonucleotides used for determining relative binding affinities of ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 .5

                                                                                                                                                                                                                                                                                                                                                             New assay for determining relative binding affinities of a ligand to different oligonucleotide sequences is useful to determine nucleic acid binding specificities and base pair determinants of particularly ligands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods for determining relative binding affinities of a ligand to different oligonucleotide sequences, using indicator oligonucleotide pairs having a signal and a signal-altering group attached in direct or competitive binding assays. The method is used to determine nucleic acid binding specificities and base pair determinants of particular ligands. The present sequence is a competitor oligonucleotide used to illustrate the method of the invention

   ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of an oligonuclectide used in a template-
dependent ligation-based method of molecular beacon (MB) synthesis. In
this method, the MB is formed by ligation of 2 (or more)
oligonuclectides, which are aligned on a template coligonuclectide sinto
oligonuclectides, which are aligned on a template coligonuclectide into
proximity for the ligation reaction to occur. The first oligonuclectide
and the template can be batch synthesised, with only the second
that is specific for a target of interest, being custom made. Ligation is
coligonuclectide (present sequence), which includes the portion of the MB
col at specific for a target of interest, being custom made. Ligation is
performed using T4 ligase, Escherichia coli ligase, a thermostable ligase
or any other enzyme capable of ligating nicks in a double-stranded DNA
condecule. The final MB (see AAT70898) has a fluorophore at its 5' (or 3')
end and a quencher molecule at its 3' (or 5') end. In non-hybridised
form, the MB forms a hairpin loop structure in which the fluorescence and
genence or interest. Hybridisation forces dissociation of the MB stem,
distancing the fluorophore from the quencher, causing an increase in
fluorescence of the MB. The modular synthesis strategy overcomes previous
problems of scalability, purification and synthesis of MBs. The MBs can
comprise nucleic acids, peptide nucleic acids, or both. They are useful
for detecting a juxtaposation of two or more target subsequences
juxtaposad by RNA splicing, RNA splicing and reverse transcription,
ligation or PCR, in a target nucleic acid. Methods, devices, ligation
mixtures and libraries of MB components are provided for high-throughput
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                             Making molecular beacons for detecting juxtaposed nucleic acids, comprises ligating two oligonuclectides corresponding to the two subsequences of beacon and monitoring ligation-dependent change in signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Apparatus for carrying out sample preparation and detection of panels of target nucleic acids and antigens in a sample, has sample preparation zone, three dimensional capture probe platforms and spacer elements.

Example 1; Page 9; 41pp; English

The invention relates to an apparatus for carrying out sample preparation and multiplex detection of panels of target nucleic acids and antigens in a sample, comprising a sample preparation zone, several three dimensional capture probe platforms for capturing specific classes of target capture probe platforms for separating the sets of three dimensional capture probe platforms. The apparatus is useful for carrying out multiplex detection of panels of target nucleic acids and/or a sample, by providing a sample containing target nucleic acids and/or antigens of interest, treating the sample with a sample buffer to form a pre-processed sample, passing the pre-processes sample buffer to form a probes of the apparatus, reacting the passing the pre-processes of the apparatus, reacting a label with a signal probe that is probes of the apparatus, for at least one other signal probe that is specific for the target and detecting the reacted level. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 10186; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine, receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject s tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. ဌ Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted tnucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 10069; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung

```
instructions for adding actrier, who muse of the kit. The composition of the invention has antialergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target many or reduce the amount of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs are submanary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense olgoss corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclestides into products that free adenosine into the system
                                                                                                                                                                                                                                                                                                                                                                                                                                           lung, brain, heart, kidney, etc, tissue environment and thereby, to

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating conforcementation, and allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dyfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition composition conforcement of the invention of the composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, and/or surfactant hypoproduction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, and/or surfactant hypoproduction respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary disease, pulmonary of hypertension, emphysema, chronic obstructions, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis or cancer. The reduced adenosine content of the anti-sense oligon content the braakdown of the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine experts and nearly and one of the content of the co

```

labeling compound

```
Novel polynucleotide having ability to increase labeling efficiency of labeling compound, useful for synthesizing labeled protein in presence of labeling compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polynucleotide having ability to increase labeling efficiency of labeling compound, useful for synthesizing labeled protein in presence of
                                                                                                                                                                The invention relates to a polynucleotide (1) for synthesizing labeled protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3' terminal of sequence encoding target protein of gene template, where labeling compound has label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound. (1) is useful for producing a labeling protein, which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the target protein, translating the gene template in the presence of the labeling compound containing acceptor portion and label portion, and obtaining protein system. The base sequence encoding the target protein and label the termination codon or contain the presence of the contain the presence of the protein and label portion.
                                                                                                                                                                                                                                                                                                                                                                                                                         the termination codon. The labeling compound is added after the initiation of the translation. The labeled protein (LPI) is useful in a performance-analysis of a protein, which involves contacting the test substance with (LPI), and analyzing the interaction between the protein and the test substance. (I) has the ability to increase labeling efficiency of a labeling compound and thus effectively produces labeled protein. This sequence corresponds to a sequence used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 8.4; DB 1; Length 12;

The invention relates to a polynucleotide (I) for synthesizing labeled protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3' terminal of sequence encoding target protein of gene template, where labeling compound as label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound. (I) is useful for producing a labeling protein, which involves preparing a gene template by adding (I) to the 3' terminal of base sequence encoding the target protein, translating the gene template in the presence of the labeling compound containing acceptor portion and label portion, and obtaining protein either renslation system. The base sequence encoding the target protein either contains the termination codon or does not contain the termination codon. The labeling compound is added after the initiation of the translation. The labeling compound is added after the substance with (LPI), and analyzing the interaction between the protein substance. (I) has the ability to increase labeling efficiency of a labeling compound and thus effectively produces labeled protein. This sequence corresponds to a sequence used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polymucleotide having ability to increase labeling efficiency of labeling compound, useful for synthesizing labeled protein in presence of labeling compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a polynucleotide (I) for synthesizing labeled

protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3, terminal of sequence encoding target protein of gene template, where labeling compound has label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound. (I) is useful for producing a labeling protein, which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the target protein, which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the target protein and label portion, and obtaining protein synthesized in the translation and label portion, and obtaining protein synthesized in the translation and label portion, and obtaining protein the termination codon. The labeling compound is added after the initiation of the translation. The labeled protein (LPI) is useful in a pubstance malysis of a protein, which involves contexting the test substance with (LPI), and analysing the interaction between the protein and the test substance. (I) has the ability to increase labeling employed protein prote

```
The invention relates to a method of analyzing haplotype, by detecting gene polymorphism in drug-related genes such as aryl acetylamine arylalkylamine N-acetyl transferace or ATP-binding cassette, and acetylase, arylalkylamine N-acetyl transferace or ATP-binding cassette, sub-family A (ABC1), member 1. The method is useful for analyzing cassette, sub-family A (ABC1), member 1. The method is useful for analyzing considering nations or a foreign material, for selecting medicine for preventing or treating disease, for analyzing a drug considered for preventing or treating a disease, for analyzing a drug cassitivity of the medicine, foreign material or disease. The diseases conclude malignant tumor, immune disease and muscle associated disease. The method enables analysis of the individual differences related to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence

           gene polymorphism in drug-related genes such as aryl acetylanide deacetylase, arylalkylamine N-acetyl transferase or ATP-binding cassette, sub-family A (ABC1), member 1. The method is useful for analyzing haplotype. The method is useful for selecting medicine for analyzing cf a medicine or a foreign material, for selecting medicine for preventing or treating diseases, for determining appropriate dosage of medicine for preventing or treating or treating a disease, for analyzing a drug interaction, and for determining the related polymorphism relative to the sensitivity of the medicine, foreign material or disease. The diseases include malignant tumor, immune disorder circulatory disease, metabolic disease, kidney disease, respiratory disease and muscle associated disease. The method enables analysis of the individual differences related to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence

The present invention relates to a method for multiplex detection of target molecules in a sample. The method comprises passing the sample cover an apparatus comprising at least one sample preparation layer, labeling the captured target molecules with a light emitting labeling entity, and detecting the light emitted to detect the presence of captured target molecules. The method is useful for integrating sample preparation and multiplex assay of high volume samples for the presence of mucheic acid and antigen targets, and for carrying out fully integrated clinical diagnostics, combining sample preparation, nucleic cid hybridization reactions and antibody/antigen reactions. The sample is contacted with a number of mediator probes prior to passing through the apparatus, and is contacted with a label mediator probe that specifically binds the target molecule, a preamplifier molecule that specifically binds the label mediator probe, at least one amplifier molecule that specifically binds the preamplifier probe, a label probe
                                                                                                                                                                                                                                                                                            ..

                                                                     The invention relates to a multifunctional siNA molecule comprising a structure having Formula MF-III and which directs cleavage of the first and second VEGF or VEGFR target sequences via RNA interference. The multifunctional siNA molecule is useful in preparing a pharmaceutical composition for treating cell proliferative disorders, e.g. cancer. The present sequence represents a VEGF siRNA.
                                                                                                                                                                                                                                                                                            Gaps

The present invention relates to a method for multiplex detection of target molecules in a sample. The method comprises passing the sample over an appearatus comprising at least one sample preparation layer, labeling the captured target molecules with a light emitting labeling entity, and detecting the light emitted to detect the presence of captured target molecules. The method is useful for integrating sample preparation and multiplex assay of high volume samples for the presence of integrated clinical diagnostics, combining sample preparation, nucleic acid hybridization reactions and antibody/antigen reactions. The sample is contacted with a number of mediator probes prior to passing through the apparatus, and is contacted with a label mediator probe that specifically binds the target molecule, a preamplifier molecule that specifically binds the label mediator probe, at least one amplifier molecule that specifically binds the beam mediator probe, at least one amplifier molecule that specifically binds the preamplifier, and a label that specifically binds the breamplifier, and a label that specifically binds the preamplifier, and a label that specifically binds the breamplifier, and a label that specifically binds the label mediator, and a label that specifically binds the label mediator, and a label that specifically binds the label probe and that emits light. The target molecules are nucleic acids, antigens or antibodies, and/or a bacterial target molecule
                                                                                                                                                                                                                                                                   ö
that specifically binds the preamplifier, and a label that specifically binds the label probe and that emits light. The target molecules are nucleic acids, antigens or antibodies, and/or a bacterial target molecule or a viral target molecule. AEBA19865-AEBA1984 are peptide nucleic acid sequences (PNA) which contains four lysine residues, and AEBA1985-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         developing products to determine p53 strue, to diagnose cancer and to developing products to determine p53 strue, to diagnose cancer and to diagnosing cancer or determiningenicity of a test agent. A method for being neoplastic comprises comparing the level of transcription of an RNA transcription of the transcription of a first tissue (t1) to the level of transcription of the same type) and the transcript is identified by a tag is an a sample second sample (s2), where all is suspected of being neoplastic and s2 is a normal human tissue (of the same type) and the transcript is identified by a tag is an adaption of some type) and the transcript is identified by a tag transcription is found to be the same or lower in the first, than in s2. The methods and products can be used to determine p53 status, to diagnose cancer and to evaluate cytotoxicity or carcinogenicity of a test agent.

AAX86201-31 represent SAGE tags used to identify transcripts which are enhanced by p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               p53 transcription tag; p53 status; cancer; cytotoxicity; carcinogenicity;
neoplastic; p53 binding site; PIG-3 promoter; SAGE tag; ss.
or a viral target molecule. AEB43965-AEB43984 are peptide nucleic acid sequences (PNA) which contains four lysine residues, and AEB43985-AEB44004 are the DNA complement sequences for the PNAs, which were used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of p53 transcription tags to determine p53 status in, e.g. cancer

```

immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the WHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for cefficient activation of cytotoxic T-lymphocytes (CTBs). Nucleic caid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly compained as hybridisation probes/amplification primers for the an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expressed genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate production of a copulation of antigen-specific effector cells) and vectors containing these can be used in gene therapy. Co-administration of tumour antigens and presentation of co-stimulatory signals, migration of chemokines for the presentation of co-stimulatory signals, migration of chemokines for recruitment of immune effector cells and secretion of recliminate and secretion of recliminate production of co-stimulatory signals, migration of cells containing recovery. ö SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; moncoyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytocoxic T-lymphocyte; tumnor antigen; immunotherapy; anticancer; ss. Sequences AAXT/7/3/2/19/109 represent SAGE (serrial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antiquenter role in the activation of the cytotoxic immune response. Antiquentarly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone calls, ranscripts presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone the tumour cells, immunostimulatory cofactors alone being required for sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly espense that modulate expression of differentially expressed genes in a APC; and as Mybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes in active immunotherapy (or to stimulate production of a cells as belonging to the monocyce lineage. Cells containing these genes population of antigen specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and population of antigen-specific effector estimulatory signals, migration of cells in active immunotherapy (or to stimulate antigen of population of co-stimulatory signals, migration of cells in cells and upragulates the APC for the recruitment of immine a fearer and secured or cells and estimulatory signals, migration of cells in the constimulatory signals, migration of cells in cell

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells. These transcripts can be used for diagnosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of cell tharactipis are used to direct expression, in selected cell types, of particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific cantibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, cells, cells, and these used for adoptive

that are preferentially transcribed in the metastatic breast tumour cells that are preferentially transcribed in the metastatic breast tumour cells). AAZ86071 tepresent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ86577 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These crissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and creatment of breast cancer, particularly where metastatic. Diagnosis is compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

Compounds Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                           Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     cancer; drug screening;

The CDNA of each gene comprises one of 200 fully defined nucleotide sequences as given in the specification. The group and the cDNAs corresponding to each of the genes in the group are useful in the diagnosis and treatment of human hepatopathy. The present sequence is a cDNA corresponding to a gene
                                                                                                                                                                                The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                 New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                            ;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamotated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (MI) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at cell state 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate continuagal drugs comprising: (a) contacting a test substance which sees expression of antifungal drugs comprising (a) contacting a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; cand (4) a method (M4) for identifying the expression in a condidate drug as a member of contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF genes may be used contacting a yeast cell with a candidate drug and controring expression in the yeast cell of at least 1 NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of phases of the cell cycle the class of cycle and for identification of antifungal drugs. AAF3326 to AAF33267 represent linkers and PCR primers used in the SAGE content of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. Sequences AAH76341-355 represent a series of 5' deletions in the MS45 promoter region, used for determining the essential region of MS45
                                                                                                                                                                                                                                                                                                                                                                                  A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.

The sequences given in AAI72704-13 are antisense oligonucleotides which were used in the method of the invention. The method of the invention comprises analysing a population of oligomeric analyse molecules (AMS) comprises analysing a population of oligomeric analyse molecules (AMS) composed of linked subunits of which at least 50% are uncharged, by applying a mixture of AMS and probe molecules to a charge-bearing separation medium, so that complementary or near-complementary regions of probe and at least one AM are hybridized to form a mixture of species and separating the species within the medium. The method is useful for analysing populations of oligomeric analyte molecules such as peptide nucleic acids, phosphotriester oligomeric analyte molecules such as peptide nucleic acids, phosphotriester oligomeric and chimeras of any member of this group with another member of with DNA, 2'-0-alkyl RNA or 2'-0-allyl RNA, in particular morpholino oligomers having intersubunit linkages such as phosphoramidate and phosphorodiamidate (claimed). The method is suitable for separating, detecting, quantitating and/or isolating predominantly uncharged oligomucleotide analogues. This sequence represents a fragment of the complement of AAI72704 which is antisense to nucleotides 2551-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Analyzing a population of oligomeric analyte molecules e.g. morpholino oligomers, peptide nucleic acids, by resolving duplexes of such molecules with complementary or near-complementary DNA or charged DNA analogs.
                                                                                     Antisense; analyte molecule; AM; probe; complementary region; c-myc;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zinc finger protein related oligonucleotide target SEQ ID NO:101.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) encoding (I) or (II); and (C1) in involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it conditions to the S2 target subsite, and selecting the F2 zinc finger such that it conditions to the S3 target subsite, and selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target for their in subsite, thus the S1 target subsite. (I) is useful in therapeutic methods to modulate the expression of a target region within a subject, in clarget sequences, as well as enhanced biological activity. ABQ71213 to target sequences, as well as enhanced biological activity. ABQ71213 to their incompletion of the present the incompletion of the present incompletion in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                    New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zinc finger protein related oligonucleotide target SEQ ID NO:1688.

the present invention describes a zinc inger protein (1) finds broad three fields. Comprising a first (81), a second (F2), and a third (F3) cance finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (81), a second (82), and a third (83) target subsite. Also described are: (1) a polymeptide (11) comprising (1); (2) a polymediacide (11) encoding (1) or (11); and (1) involves selecting the F1 zinc finger such that it binds to the S2 target subsite, selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (1) that binds to that it binds to the S3 target subsite, thus designing (1) that binds to the tit binds to the S3 target subsite, thus designing (1) that binds to the tit binds to the S3 target subsite, thus designing (1) that binds to the tit binds to the S3 target subsite, thus designing (1) that binds to the tit binds to the S3 target subsite, thus designing (1) that binds to useful in studying gene function, and for human therapeutic and plant engine fin studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced hological activity ABG71213 to ABG72214 and ABB48191 to ABB751230 represent DNA target sequences and zinc in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                            useful in studying engineering, comprises N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a zinc finger protein (I) that binds to a
